#6 - December 06, 2019 15:13 - Jim Turner

- File *main.cc* added

Wow, I'd forgotten a/b this! Since then I've also got it working on the Qt side too. Here's my code for skins-qt/main.cc. The only part that you'll need to look at is lines 87-89 and 537-547 (enterEvent()). I would just first go ahead and test it out in Audacious-GIT and then just send you a working Audacious patch for it, but I'm on travel for the week and don't have Qt on this box.

Thanks!

Jim

#7 - December 06, 2019 16:47 - John Lindgren

In theory, the change I pushed on the GTK side should translate almost directly. (Widget::motion() and Widget::leave() already exist in the Qt version as well.) However, it didn't work when I tested it last night. It seemed like Widget::motion() wasn't getting called for top-level widgets, for some reason I couldn't figure out. If you can figure that out, and get something tested working for Qt, please post it in a new issue.
