

Audacious - Feature #769

Add custom pictures to ~/.config/audacious/

Description

So audacious has it's own images in this folder: /usr/share/audacious/images

What I do every time I install (or update) is to replace album.png with my own image (to look better with my KDE system). I simply use sudo cp for that. I will provide my image example down bellow.

My suggestion is, can you allow custom images to be placed in the audacious config folder and be used instead of the defaults in /usr/share? Even better if you can allow svgs for that too.

Thank you.

I am very sorry, I forgot to change the tracker from bug to request... also I can't find a way to change it or delete this one.

In master, we no longer ship any icons in /usr/share/audacious/images. Instead we use icons from the current theme. So what you should see now is this one:

<https://github.com/KDE/breeze-icons/blob/master/icons/mimetypes/64/audio-x-generic.svg>

Is that good enough?

#5 - January 22, 2018 18:17 - Raitaro Hikami

It is a good idea to use system icons. I wasn't aware of this. I still have icons in /usr/share myself.

Thank you.

- Status changed from New to Closed

Okay, I will close this then. The change was made just in the few days.
