Description			
hi			
Recently adplug uses now opl'emulation source code from dosbox. You can read that on github of adplug.			
I noticed when playing opl2 or opl3 music, audacious does not sound the same as dosbox or any player using latest adplug.			
Is it possible audacious is using an older version of adplug?			
If yes, could it be updated to latest version?			
thx

Audacious source code does not include adplug. You should update adplug through the normal means (i.e. your package manager).

I'm using windows version.

How to change adplug for the windows version?

What AdPlug version is included in the windows version?

Is it the latest version?

From the website:

Instructions for installing Audacious from source in Windows can be found in the “audacious” source package, in the win32 folder.

Those instructions list the library versions that we use for the official builds. You can try your luck with building a different version, if you like.
