

## Audacious - Support #1040

### Couple of questions

<b>Description</b> 1) Window-grouping question: When using Qt or skins interfaces, and have multiple Audacious windows, ie. plugins, etc. and I click on another application's window (it properly comes up on top), then click on any Audacious window, all come back up to the top (which is ideal). However, in the GTK interface, this is not the case, only the window clicked on comes on top (windows are independent)? Window-manager doesn't seem to matter. Not an issue, just curious what's different in the code that enables the window-grouping in the skins-GTK code, but not the other GTK interface code? (Technical/programming info desired - I MAY be looking to take a stab at patching - first thought the lack of <code>gtk_window_set_transient_for()</code> in <code>layout.cc</code> , which worked, but did not fix issue).  2) What does the "Queue Manager" do and how does one use it (I've never used it & it just has a blank window with a single button)?  3) Why is the GTK equalizer always stay on top (it has <code>GDK_WINDOW_TYPE_HINT_DIALOG</code> set)?  Thanks for any help!  Jim

2) What does the "Queue Manager" do and how does one use it?

You can queue tracks there to play them in the given order.  
Right click on a track in the playlist and select "Queue/Unqueue" or use ALT+Q.

Qt and GTK are two very different toolkits; I'm afraid you'd have to study each one to figure out exactly why window behavior may be different ...
