Description			
Now it is possible to create playlist based on search results, but when using search in library mode (this is, using your whole collection as a playlist) you cannot "jump" to a song or add it to queue, thus searching for a certain song can only be done manually. Adding an "add to queue" menu option in search results improves usability.

This feature exists already (actually, it predates the "library" feature even).

In the GTK+ interfaces, it's a popup window called Jump To Song (Ctrl+J). There are "Jump" and "Queue" buttons in this window.

In the new Qt UI, the whole playlist turns into a list of search results when you press Ctrl+F and start typing. When you find the song you want, you can use the normal playlist shortcuts to jump to the song (Enter) or enqueue it (Alt-Q).
